
STAGES OF AUTOMATION OF GRAIN PROCESSING

Grain processing is one of the most important branches of the food industry. Modern technologies and automation methods allow for a significant increase in the efficiency and quality of the production process. The introduction of automation in the production processes of grain processing is a complex of measures aimed at automating and optimizing various stages of production. This can include automatic control and regulation of production parameters, the use of modern equipment, and the application of software and technologies.
